

UNIVERSITY OF TARTU

Wearable sensors for mobility statistics

Pilleriine Kamenjuk MSc
Anto Aasa PhD

Mobility Lab of University of Tartu

31.01.2019

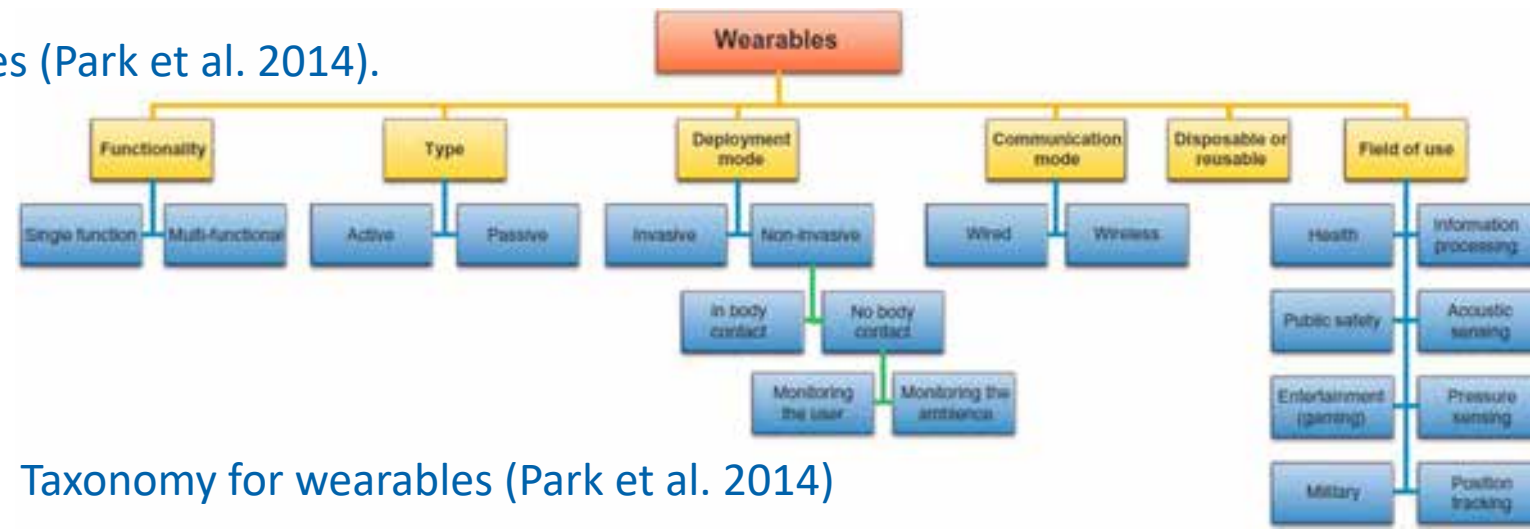

Migration and mobility are both the great potential and challenge of the 21st century!

- Mobility as a phenomenon has changed.
- Understand the context and causality.
- Different and new data sources.

Wearable technology and sensors

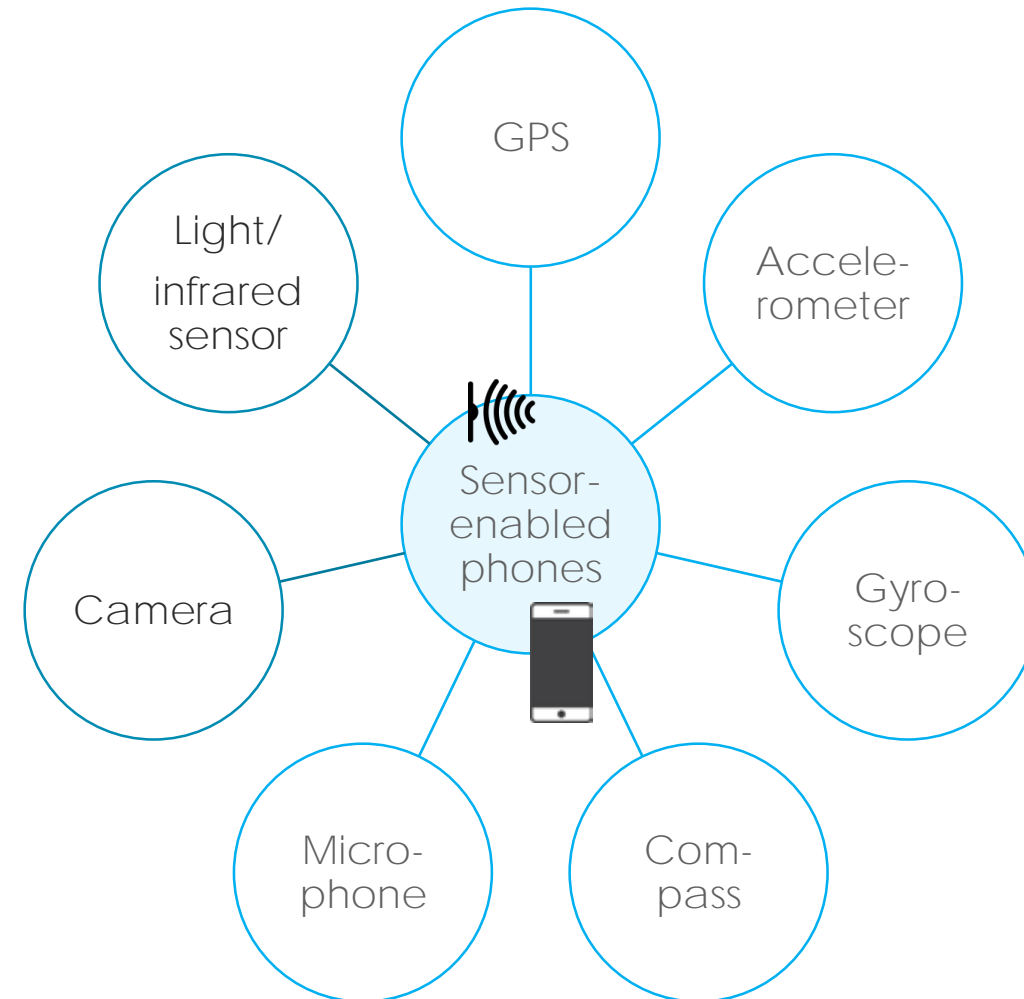

- Wearable technology – „refers to accessories and clothing incorporating computer and advanced electronic technologies“ (PwC 2016).
- Examples: smart glasses, fitness band, smart clothing, smart watch, smartphone, etc.
- Use cases: health & sports, public safety, entertainment, remote control, science, etc.
- „Keeping the wearable commitment“ (PwC 2016) – adoption, users' needs, convenience.
 - Physical and functional attributes (Park et al. 2014).

Taxonomy for wearables (Park et al. 2014)

Mobile phone as a wearable sensor

- Multi-functional
- Non-invasive (?)
 - Other phone data: information as a by product of ICT services (CDR, signaling, Bluetooth, app use data)
- Wireless, etc.
- Individual → Community
- Wide, increasing use
 - Sample, spatial and temporal resolution, long term → statistics
- Use cases: mobility patterns, behavioural studies, social media use, etc.

Focus of Mobility Lab on using mobile (sensor) data

- CDR data
- Data from mobile application (Mobility Log)
- Population statistics
 - Census
 - Migration
 - Commuting
- Central places & catchment areas
- Tourism statistics
 - Local
 - Inbound
 - Outbound
- Spatial segregation
- Accessibility
- Transport demand

Memory files of mobile operators

- Call detail records (CDR) – location and time of call and number of respondent (user id, location, time).
- Passive mobile positioning.

data table

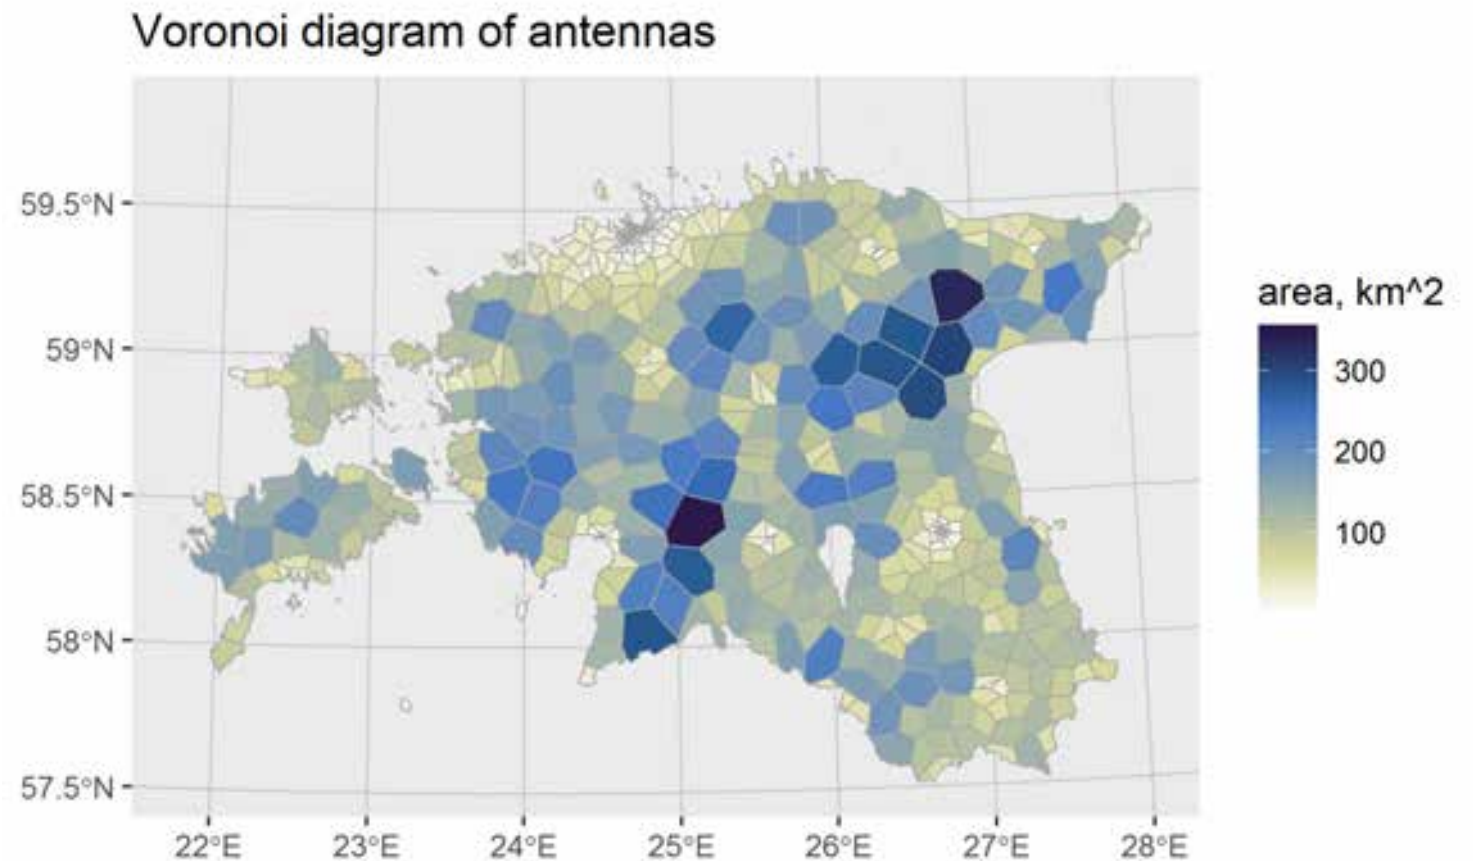

parameter	value
ID	246513389
event	call
timestamp	12:15:11 07/04/2014
cell ID	6547

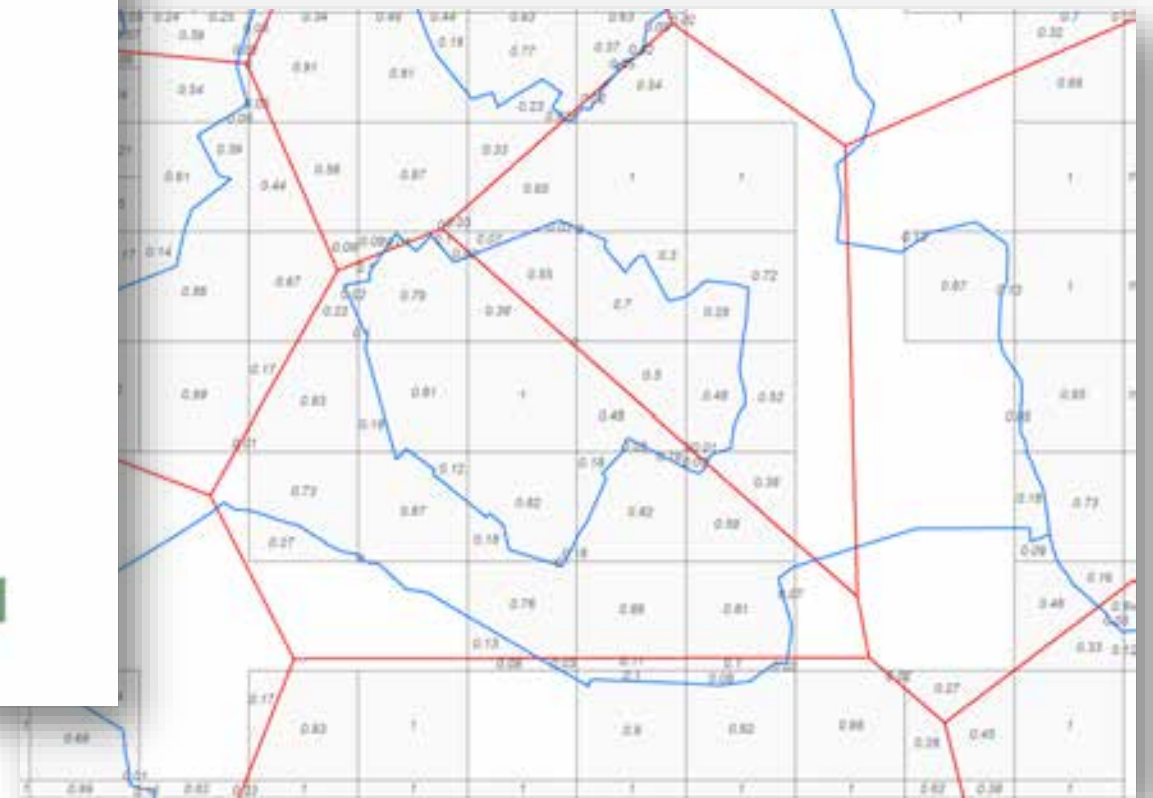

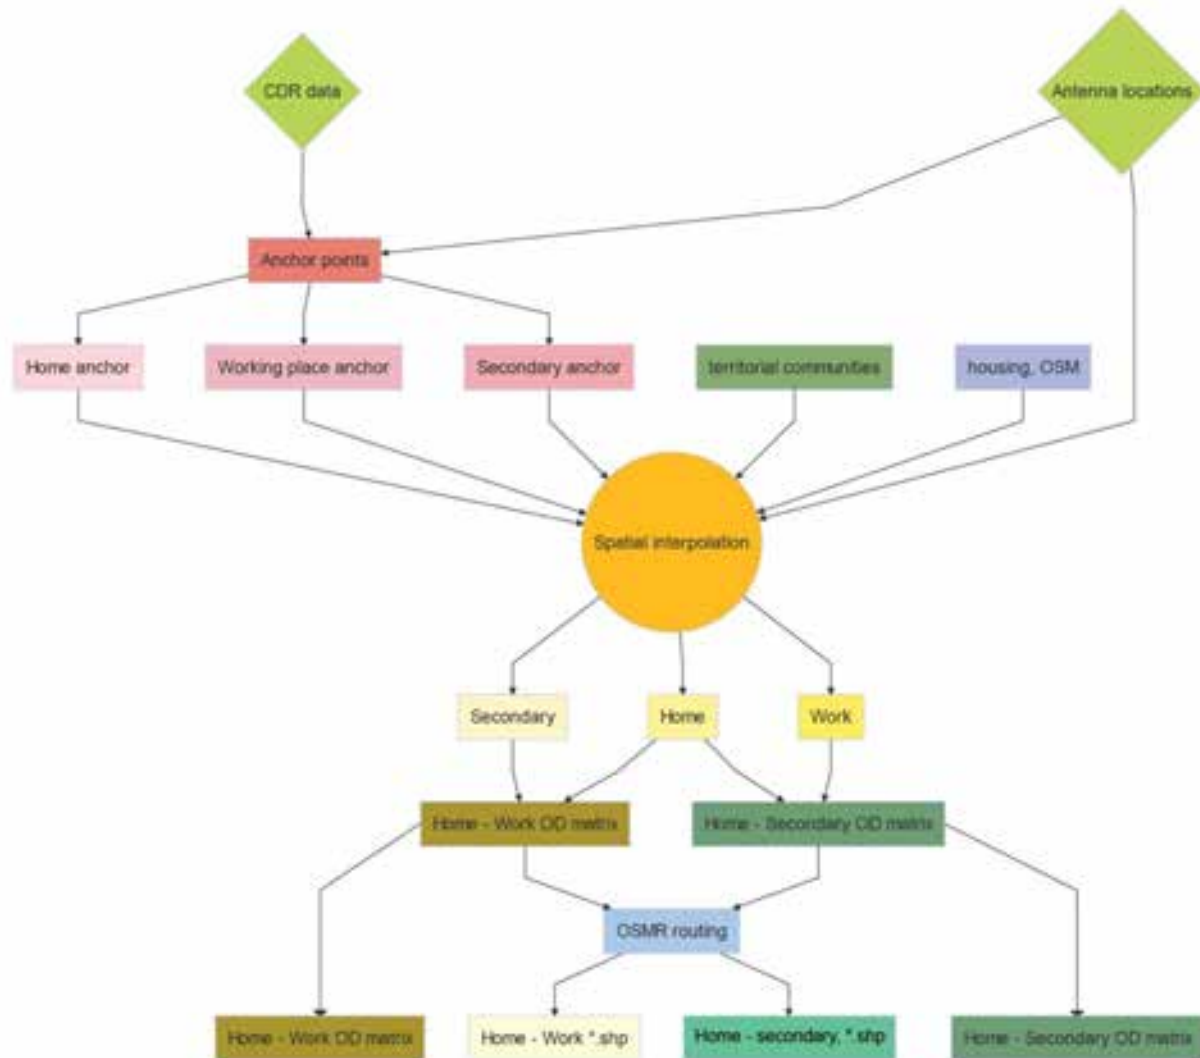

antennas table

parameter	value
cell ID	6547
longitude	25.80527
latitude	58.34998

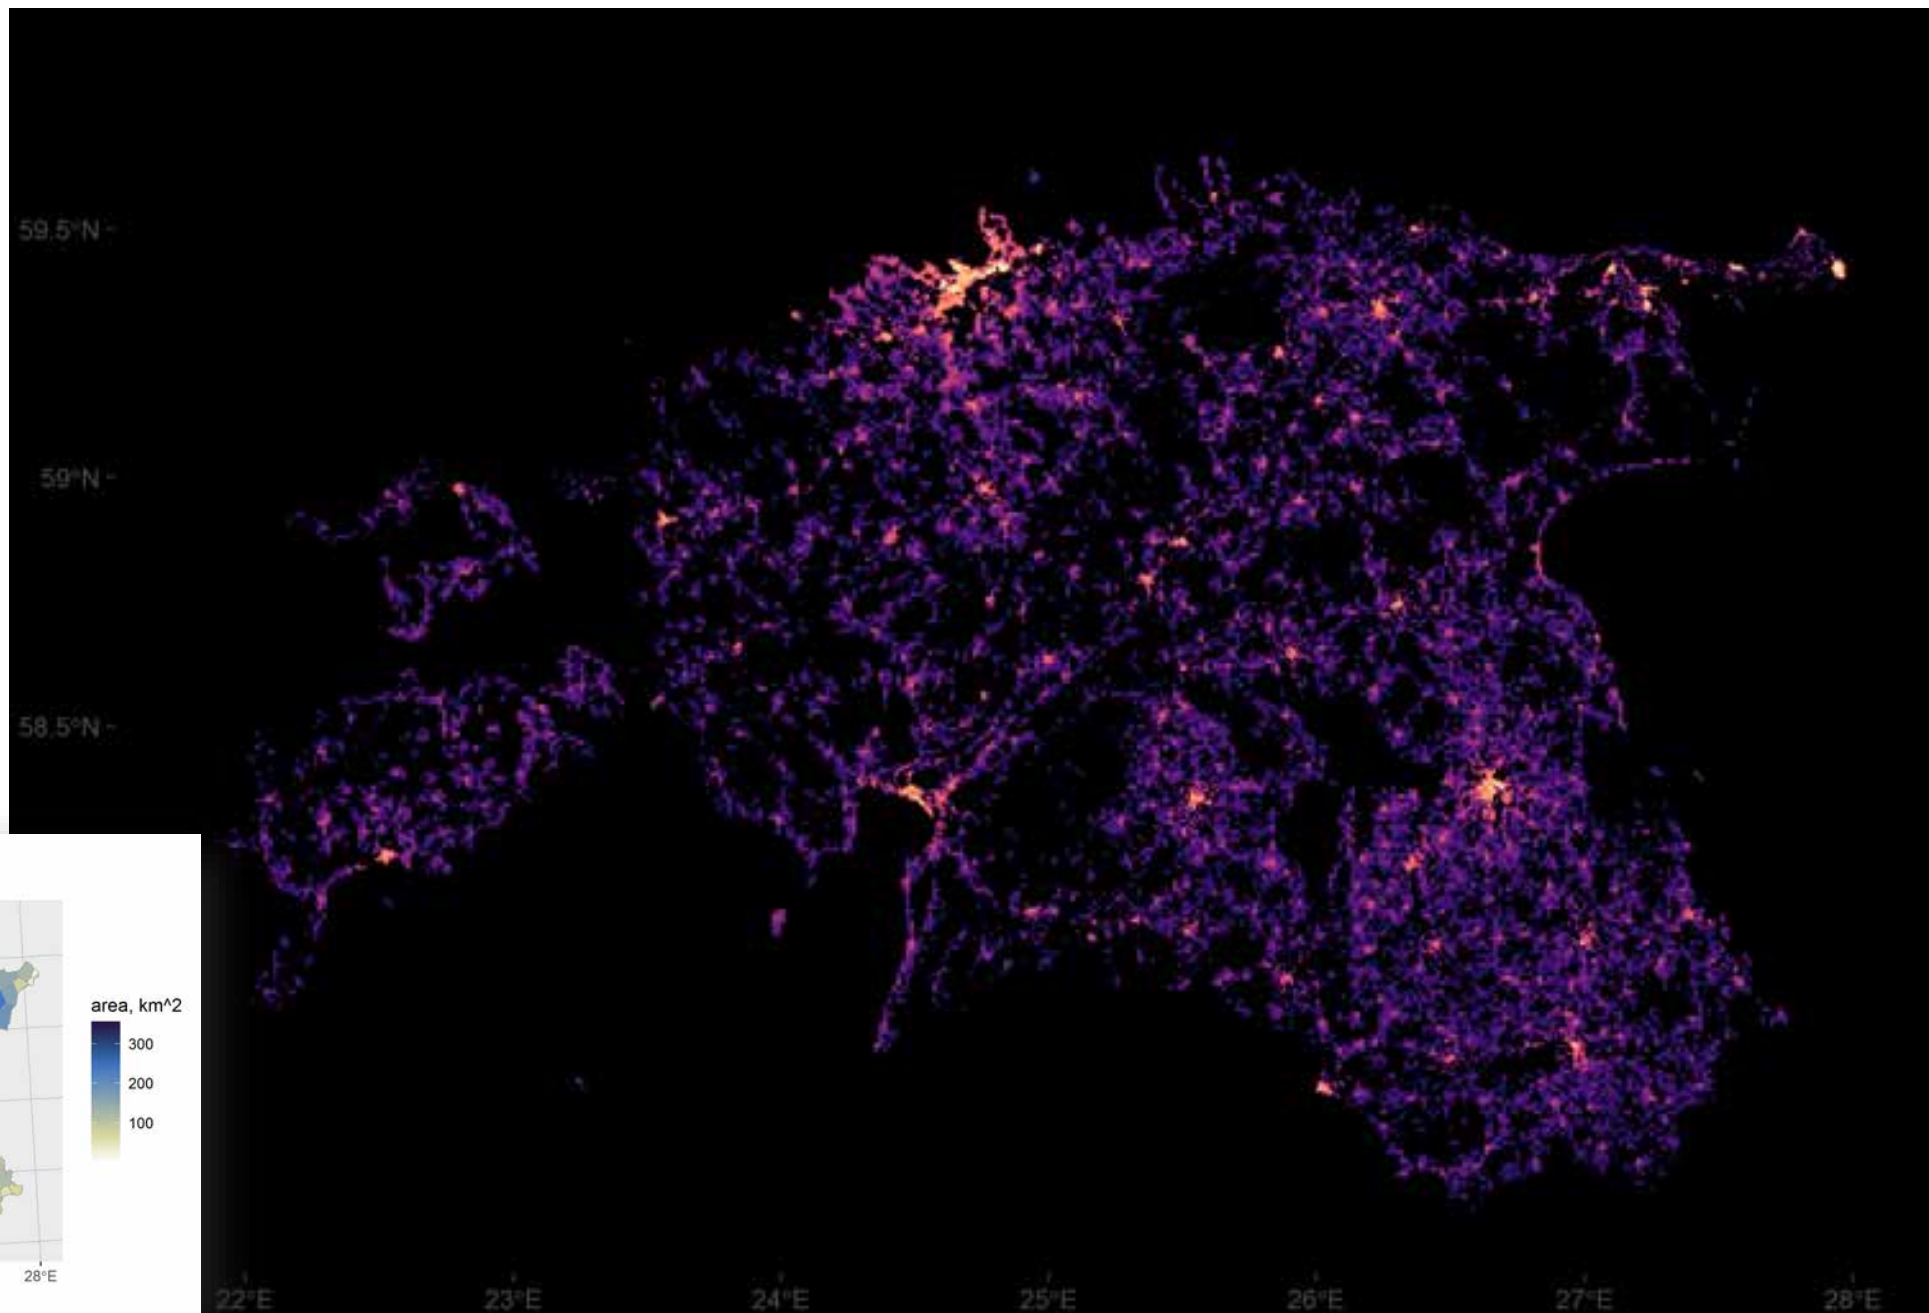

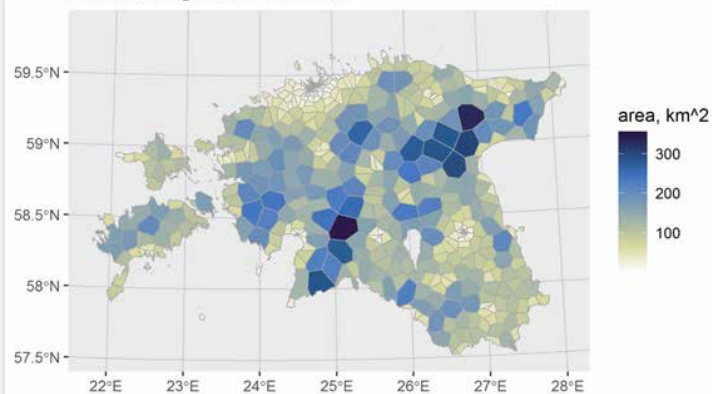

Spatial resolution of CDR

Mobile Census

Infotechnological Mobility Observatory

- The aim of IMO is to develop a **data infrastructure that supports mobility studies.**
- **Integrate** different data:
 - data obtained from mobile phones and other IT tools,
 - country-specific e-data (censuses, registers, databases, etc.),
 - contextual data and descriptions (environmental information, land use functions, etc.).

UNIVERSITY OF TARTU

Thank you!
